The sequences given in AAR65782-88 are linear and cyclic peptides which may be used for bringing about a sexual response or for diagnosing psychogenic sexual dysfunction in males. These peptides specifically bring about penile erection, however at higher doses some stomach discomfort was noted. The peptides were prepared by standard methods of solid phase synthesis. (Updated on 25-WAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /note= "Amidated C-terminal, forms peptide linkage with Asp2"

                                                                                                                                                                                       The terminal amino gp. of the peptide is joined (opt. via spacer) to chelating gp. The C-terminal of the peptide is amidated. The substit. on the side chain gp. of the residue in the 11-position is selected so that it does not significantly interfere with or impair the binding affinity of the peptide to the MSH receptors. The peptide is useful when labelled with a detectable element in in vivo diagnostic and therapeutic applications. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Linear; cyclic; sexual response; psychogenic sexual dysfunction; male; penile erection; stomach discomfort.

They can be used, in conjunction which testosterone or another androgen, to treat impotence in elderly men whose testosterone levels are declining with age. The peptides also appear to have an effect of increasing sexual response in females. They may therefore be administered to increase libido in female animals of rare species in captivity at the proper time in their oestrus cycle to make them more receptive to coitus. They may also be administered to the male animal at the same time to induce the erectlia response. The peptides may be used in artificial insemination programmes to encourage an animal, e.g. a stallion, to mount a mock female phantom used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Diagnosis and treatment of erectile dysfunction - by administering an erectogenic peptide containing the sequence Nle-Asp-His-D-Phe-Arg-Trp-

They can be used, in conjunction with restosterone or another androgen, to treat impotence in elderly men whose testosterone levels are declining with age. The peptides also appear to have an effect of increasing sexual response in females. They may therefore be administered to increase libido in female animals of rare species in captivity at the proper time in their oestrus cycle to make them more receptive to coitus. They may also be administered to the male animal at the same time to induce the erectile response. The peptides may be used in artificial insemination programmes to encourage an animal, e.g. a stallion, to mount a mock female phantom used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Diagnosis and treatment of erectile dysfunction - by administering an erectogenic peptide containing the sequence Nle-Asp-His-D-Phe-Arg-Trp-

These analogues are used for stimulating melanocytes to cause darkening of the skin without the need to expose the skin to sunlight or UV radiation. They are used especially for normalising hypopigmentation
collection of sperm. The peptides invariably induce an erection in men low doses (e.g. 1-10 mg) and without any detectable side effects when administered systemically. The peptides, at low doses, also allow detumescence following ejaculation

stimulating hormone (alpha-MSH). It is used to stimulate mammalian melanocytes to produce integumental melanni, i.e. to treat mammalian phypoigementation such as pityriasis alba, tinea versicolor, vitiligo, idiopathic guttae hypomelanosis and nevus depigmentosus. It can also be used to darken grey hair and to increase the value of animal pelts. The used to darken grey hair and to increase the value of animal pelts. The peptide can replace alpha-MSH, or its Nle4 analogue, in all diagnostic, therapeutic and research applications, e.g. localisation/ characterisation of melanoma calls, and as ligand to deliver anticancer or diagnostic agents. Also treatment with the peptide darkens the skin without any exposure to UV light. In bioassays on frog skin and on lizard with the present peptide had melanocyte dispersion activities of 0.7 and 8.0, respectively, relative to native alpha-MSH having activities of 1.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New cyclic peptide analogues of alpha-melanocyte stimulating hormone - for treatment of hypo:pigmentation and for darkening human hair or animal pelts, have prolonged action.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This peptide is a synthetic, linear analogue of human alpha melanocyte
                                                                                                                                  Human alpha-melanocyte stimulating hormone; analogue; alpha-MSH; alpha-melanotropin; proopiomelanocortin; hypopigmentation; pityriasis alba; tinea versicolor; vitiligo; idiopathic guttae hypomelanosis; nevus depigmentosus; animal pelt.
                                                                                                 Linear human alpha-melanocyte stimulating hormone analogue 7.
                                                                                                                                                                                                                                                                                                                              /note= "N-acetyl Norleucine"
                                                                                                                                                                                                                                                                                                                                                                                                     /note= "C-terminal amide"

ö
melanocytes to produce integumental melanin, i.e. to treat hypopigmentation such as pityriasis alba, tinea versicolor, vitiligo, idopathic guttae hypomelanosis and nevus depigmentosus: It can also be used to darken grey hair and to increase the value of animal pelts. The peptide can replace alpha-MSH, or its Nle4 analogue, in all diagnostic, therapeutic and research applications, e.g. localisation/ characterisation of melanoma cells, and as ligand to deliver anticancer or diagnostic agents. Also treatment with the peptide darkens the skin without any exposure to VN light. In bioassays on frog skin and on lizard skin, the present peptide had melanocyte dispersion activities of 0.5 skin, the caspectively, relative to native alpha-MSH having activities of 1.0 in both bioassay systems and showed prolonged activity in both assays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "C-terminal amide; the side-chain amino group of
Lys-NH2 at position 7 forms a lactam bridge with the side
-chain carboxyl group of Asp at position 2"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note= "The side-chain carboxyl group of Asp at position 2 forms a lactam bridge with the side-chain amino group of Lys at position 7"

                                                                                                                                                                                                                                                                                                                                                                                                          8
                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                      This peptide is a synthetic, cyclic analogue of human alpha melanocyte stimulating hormone (alpha-MSH). It is used to stimulate mammalian melanocytes to produce integumental melanin, i.e. to treat we as such as pityriasis alba, tinea versicolor, vitiligo, hypopigmentation such as pityriasis alba, tinea versicolor, vitiligo, liopathic guttae hypomelanosis and nevus depigmentosus. It can also be idiogathic guttae hypomelanosis and nevus depigmentosus. It can also be used to darken grey hair and to increase the value of animal pelte. The used to arreplace alpha-WSH, or its NIe4 analogue, in all diagnostic, peptide can replace alpha-WSH, or its NIe4 analogue, in all diagnostic, characterisation of melanoma cells, and as ligand to deliver anticancer characterisation of melanoma cells, and as ligand to deliver anticancer without any exposure to UV light. In a bioassay on frog skin, the present without any exposure to UV light. In a bioassay on frog skin, the present peptide had a melanocyte dispersion activity of 5.0, relative to native alpha-MSH activity of 1.0 and also showed prolonged activity
                         New cyclic peptide analogues of alpha-melanocyte stimulating hormone -
for treatment of hypo:pigmentation and for darkening human hair or animal
pelts, have prolonged action.
                                                                                                                                                                                                                                                                                                                                                           Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human alpha-melanocyte stimulating hormone; analogue; alpha-MSH; alpha-melanotropin; proopiomelanocortin; hypopigmentation; pityriasis alba; tinea versicolor; vitiligo; idiopathic guttae hypomelanosis; nevus depigmentosus; animal pelt.

This peptide is a synthetic, linear analogue of human alpha melanocyte stimulating hormone (alpha-WSH). It is used to stimulate mammalian carimulating hormone (alpha-WSH). It is used to treat melanocytes to produce integumental melanin, i.e. to treat melanocytes to produce integumental melanin, i.e. to treat melanocytes to produce integumental melanin, i.e. to treat caricolar, vitiligo, integrate hypomelanosis and nevus depigmentosus. It can also be used to darken grey hair and to increase the value of animal pelts. The used to darken grey hair and to increase the value of animal pelts. The peptide can replace alpha-MSH, or its M164 analogue, in all diagnostic, therapeutic and research applications, e.g. localisation/ characterisation of melanoma cells, and as ligand to deliver anticancer characterisation of melanoma cells, and as ligand to deliver anticancer characterisation of melanoma cells, and as ligand to deliver anticancer characterisation peptide had melanocyte dispersion activities of skin, the present peptide had melanocyte dispersion activities of and 0.08, respectively, relative to native alpha-MSH having activities of 1.0 in both bloassay systems. The peptide also showed prolonged activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Metallo-construct; metal ion-binding backbone; cyclic;

The sequence is a specifically claimed example of new linear analogues of alpha-melanocyte stimulating hormone (alpha-MSH) having the general formula AA1-NIe-AA2-His-AA4-AA5, in which: AA1 = AC (i.e. AA2-His-AA3-Arg-Trp-AA4-AA5, in which: AA1 = AC (i.e. Lys, Cly, Orn (i.e. ornithine), Dab (i.e. 2,4-diaminobutyric acid) or Dpr (i.e. 2,3-diaminopropionic acid), and AA5 = NH2 or Gly-Pro-Val-HN2. These analogues can be administered trans-cutaneously (e.g. topically) to treat skin hypo-pigmentation disorders, to darken grey hair, to enhance the value of animal pelts by darkening, or to darken the skin in the absence of solar or tur radiation. They could also be used in diagnostic or cresarch applications for detecting melanoma cells, and for targeting dange or diagnostic agents to tissues with a high concentration of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            alpha-Melanotropin peptide analogues - useful for darkening skin or hair,
   alpha-Melanotropin peptide analogues - useful for darkening skin or hair,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note= "Lys-NH2; i.e. the C-terminal is amidated"

                                                                                                                                                                                                                                                                                                                                                                              ö
                         Metallo-constructs comprising a metal ion-binding backbone for complexing metals - and a biological function domain which may be converted from inactive to active form on binding of the construct to a metal ion.
                                                                                                                                ion and
                                                                                                           The specification describes a metallo-construct, which may be a peptide, comprising metal ion-binding backbone for complexing with a metal ion and a biological function domain which is conformationally constrained upon complexing the metal ion-binding backbone with a metal ion. The peptide/metal ion complexes are less susceptible to proteolysis than the uncomplexed peptide. The peptides lack conformational restriction if not complexed to a metal ion, so that the uncomplexed peptides are either inactive or low in potency. The complexed peptides may also exhibit altered biodistribution profiles, rate of clearance from the body and bioavailability. The constructs/peptides are useful as biological, therapeutic, diagnostic imaging and radiotherapeutic agents, or in combinatorial chemistry methods. The present cyclic peptide exemplifies the peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Melanocyte stimulating hormone; MSH; melanotropin; pigmentation.

                                                                                                                                                                                                                                                 셤
                                                                                                                                                                                                            ö
                  The sequence is a specifically claimed example of new linear analogues of alpha-melanocyte stimulating hormone (alpha-MSH) having the general formula AA1-NIe-AA2-His-AA3-Arg-Trp-AA4-AB5, in which: AA1 = AG (i.e. Ac-Ser-Tyr-Ser; AA2 = Glu or AB9; AA3 = D-phe or Phe; AA4 = acetyl) or Ac-Ser-Tyr-Ser; AA2 = Glu or AB9; AA3 = D-phe or Phe; AA4 = (i.e. 2,3-diaminoputyric acid) or Dpr (i.e. 2,3-diaminopropionic acid); and AA5 = NH2 or Gly-Pro-Val-NH2. These analogues can be administered trans-cutaneously (e.g. topically) to treat skin hypo-pigmentation disorders, to darken grey hair, to enhance the value of animal pelts by darkening, or to darken the skin in the absence of solar or UV radiation. They could also be used in dispnostic or research applications for detecting melanoma cells, and for targeting melanotropin receptors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /note= "Carboxyl side-chain of Asp2 forms a lactam bridge
with the amino side-chain of Lys?"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cyclic peptide melanocortin analogues - useful as melanocortin receptor antagonists or agonists e.g. for research.

This sequence represents a specifically claimed cyclic lactam peptide of formula Ac-Nle-Asp-His-X-Arg-Trp-Lys-NH2 [1], (Asp and Lys are joined to make the ring). X = D-2'-naphthylalanine (Ia) or D-p-iodo-phenylalanine (Ib). These cyclic peptides are potent and specific antagonists of the two neural melanocortin receptors and of the peripheral receptor. (Ia) is a potent antagonist of the MC3 and MC4 receptors with partial agonist a potent antagonist of the MC3 and MC4 receptors with partial agonist potent antagonist of the MC3 and MC4 receptors with partial agonist activity. Both peptides have antagonist activities in the classical frog skin bioassay for pigmentation at the MC1 receptor. (I) are used for studying the physiological role of these receptors and possibly for treating melanoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note= "Carboxyl side-chain of Asp2 forms a lactam bridge

    This seguence represents a specifically claimed cyclic lactam peptide of formula Ac-Nle-Asp-His-X-Arg-Irp-Lys-NH2 [1], (Asp and Lys are joined to make the ring). X = D-2'-naphthylalanine [Ta) or D-p-iodo-phenylalanine (Ib). These cyclic peptides are potent and specific antagonists of the two neural melanocortin receptors and of the peripheral receptor. (Ia) is a potent antagonist of the MC3 and MC4 receptors with partial agonist activity, and a full agonist of the MC1 and MC5 receptors; (Ib) is a potent antagonist of the MC3 and MC4 receptors with partial agonist activity. Both peptides have antagonist activities in the classical frog skin bioassay for pigmentation at the MC1 receptor. (I) are used for studying the physiological role of these receptors and possibly for blocking physiological responses to endogenous melanotropin, e.g. for

The invention relates to methods and compositions for the regulation of body weight, and for the treatment of associated disorders, comprising the administration of a proopiomelanocortin (POMC) compound to peripheral tissues such that delivery to the central nervous system is minimised. The amount of POMC compound used is insufficient to alter appetite and is preferably in the range 0.1 microgram-10 mg/Kg. The primary aim of the cinvention is therefore to effect weight regulation via the control of the lipid mobilisation and sequestration in adipose tissue (peripheral pathways of energy homeostasis) rather than via appetite modification (central pathways of energy homeostasis). The POMC compounds of the invention regulate fat stores in adipose tissue by altering free fatty cinvention regulate fat stores in adipose tissue by altering free fatty concern disorders of body weight such as obealty, anorexia, bullmia, cachexia and wasting disorders. They can be used to treat or prevent disorders that can be associated with obesity (such as cardiovascular disorders that can be associated with low body weight (such as heart failure, immune can be associated with low body weight (such as heart failure, immune system weakness, amenorrhoea and dapression), and disorders that compounds of the invention include melanocyte stimulatory hormone (MSH) analogues. MSH agonists reduce body weight, while MSH antagonists increase body weight. The compounds of the invention provides alpha-MSH apptide analogues (AABI1885-BI1886) and central energy homeostasis pathways. Sequences AABI1885-BI1886 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

of this residue is linked to
Lys at position 7 by a lactam
                                                                                                                                                                                                                                                                                                                                    Peptides (AAY53555)-(AAY53563) represent synthetic ligands that selectively interact with melanocortin (MC) receptors, and exhibit biological activity in vivo. The peptides are modified from alphamelanocyte stimulating hormone (alpha-MSH) and show distinct neurophysiological effects displayed as behavioural patterns. The peptides are useful for treating disorders associated with MC receptors, especially neurological, behavioural, cardiovascular, metabolic, sexual dysfunction, or nerve damage caused by other therapy. The peptides are specific for MC receptors, especially MC3, MC4 and MC5 receptors, and their activity has been characterized in vivo
                                                                                                                                                                                                                                                                       New peptides that selectively interact with melanocortin (MC) receptors, useful for treating disorders associated with MC receptors e.g. neurological and behavioral disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ligand; melanocortin receptor; alpha-melanocyte stimulating hormone; MSH; neurophysiology; behavioural pattern; neurology; cardiovascular; metabolism; sexual dysfunction; nerve damage; therapy; cyclic.
/note= "side chain carboxyl of this residue is linked to
the side chain amide of the Lys at position 7 by a lactam
bond to form a cyclic structure"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptides (AAY53555)-(AAY53563) represent synthetic ligands that selectively interact with melanocortin (MC) receptors, and exhibit biological activity in vivo. The peptides are modified from alphamelanocyte stimulating hormone (alpha-MSH) and show distinct neurophysiological effects displayed as behavioural patterns. The specials neurological behavioural, cardiovasscular, metabolic, sexual dysfunction, or nerve damage caused by other therapy. The peptides are specialic for MC receptors, especially MC3, MC4 and MC5 receptors, and their activity has been characterized in vivo
                                                                                                                                                                                                                                                                                   /note= "Amidated C-terminus; side chain amide of this residue is linked to the side chain carboxyl of the Asp at position 2 by a lactam bond to form a cyclic structure"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New peptides that selectively interact with melanocortin (MC) r useful for treating disorders associated with MC receptors e.g. neurological and behavioral disorders.

The invention relates to the use of a melanocyte stimulating hormone (MSH), analogue or functional fragment in the treatment of scarring. This sequence represents an analogue of the human alpha-MSH. MSH is an inhibitor of proinflammatory vytokine production, a regulator of nitric oxide synthase and a stimulator of antiinflammatory IL-IO synthesis. MSH, or its analogues, is useful in the preparation of a composition for the appearance of existing and chronic wounds, and for improving the appearance of existing scars, especially scarring associated with pulmonary fibrosis, muscular and neuronal trauma, intestinal obstruction, impaired vision and hearing (from scarring of corneal or tympanic membrane) are treated using compositions containing the MSH analogues
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Use of a neuropeptide for prevention and treatment of scars and chronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note= "This residue condenses with the Lys residue at

                                                           /note= "gide chain carboxyl of this regidue is linked to the side chain amide of the Lys at position 7 by a lactam bond to form a cyclic structure"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Peptides (AAY53555)-(AAY53563) represent synthetic ligands that selectively interact with melanocortin (MC) receptors, and exhibit biological activity in vivo. The peptides are modified from alphamelanocyte stimulating hormone (alpha-MSH) and show distinct neurophysiological effects displayed as behavioural patterns. The peptides are useful for treating disorders associated with MC receptors, especially neurological, behavioural, cardiovascular, metabolic, sexual dysfunction, or nerve damage caused by other therapy. The peptides are specific for MC receptors, especially MC3, MC4 and MC5 receptors, and their activity has been characterized in vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New peptides that selectively interact with melanocortin (MC) receptors, useful for treating disorders associated with MC receptors e.g. neurological and behavioral disorders.

                                                                                                                                                                                                                                                                                          This invention describes novel cyclic polypeptides (I) for inhibiting melanocortin receptors. (I) are useful for inhibiting melanocortin receptors and may be useful in treatment of learning and memory processes, sexual behaviour. regulation of body temperature and immune response and as a vehicle for drugs across the blood-brain barrier. They may also be used as research tools and for screening drugs. The peptides are selectively antagonistic for the melanocortin 1, 3, 4 and 5 receptors. This sequence represents a melanocortin antagonist described
                                                                                                                                                                                                                                        Cyclic polypeptide useful for inhibiting melanocortin receptors comprise sequences with modified amino acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note= "This residue condenses with the Lys residue at position 7 to form a cyclic peptide" ^4

(I) are useful for inhibiting melanocortin receptors and may be useful in treatment of learning and memory processes, sexual behaviour, regulation of body temperature and immune response and as a vehicle for drugs across the blood-brain barrier. They may also be used as research tools and for screening drugs. The peptides are selectively antagonistic for the melanocortin 1, 3, 4 and 5 receptors. This sequence represents a melanocortin antagonist described
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cyclic polypeptide useful for inhibiting melanocortin receptors comprise sequences with modified amino acids.
/note= "This residue condenses with the Asp residue at
position 2 to form a cyclic peptide. C-terminal amide"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             the Lys residue at

The present invention relates to treating erectile dysfunction in humans. The method involves administering an agonist of the melanocortin receptor in combination with a cyclic-GMP-specific phosphodiseterase inhibitor (CPI) or an alpha-adrenergic receptor antagonist (ARA). This combination provides effective treatment of either psychogenic or organic erectile dysfunction in a greater percentage of the affected population, provides for a shorter onset and longer duration of action and has fewer side effects than either member of the combination separately. The present sequence is melanotan-II. This peptide is a synthetic melanocortin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Agouti signalling protein; agouti related peptide; AGRP; ASP; obesity; eating disorder; antibody; probe; melanocortin; receptor.
                                                                                                                                                                                                                   Treating erectile dysfunction in human comprises administering melanocortin receptor agonist in combination with cyclic-GMP-specific phosphodiesterase inhibitor or alpha-adrenergic receptor antagonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  100.0%; Score 36; DB 3;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes novel cyclic polypeptides (I) for inhibiting melanocortin receptors. (I) are useful for inhibiting melanocortin receptors and may be useful in treatment of learning and memory processes, sexual behaviour, regulation of body temperature and immune response and as a vehicle for drugs across the blood-brain barrier. They may also be used as research tools and for screening drugs. The peptides are selectively antagonistic for the melanocortin 1, 3, 4 and 5 receptors. This sequence represents a melanocortin antagonist described
                                                                                                                                                                                                                                                                                                                                       Cyclic polypeptide useful for inhibiting melanocortin receptors comprise sequences with modified amino acids.
                 /note= "This residue condenses with the Asp residue at position 2 to form a cyclic peptide. C-terminal amide"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MT-II; melanotan-II; PT-14; alpha-adrenergic receptor antagonist; cyclic-GMP-specific phosphodiesterase inhibitor; CPI; ARA; erectile dysfuction.

                                                                                   Agouti related peptides, their fragments, variants or derivatives may be used as modulators of feeding behavior (e.g. to treat obssity) and to generate anti-agouti-related polypeptide (AGRP) and anti-agouti-signaling protein (ASP) antibodies. Nucleic acids encoding these peptides may be used as hybridization probes in assays. The antibodies may be used to inhibit the binding of the AGRP/ASP peptide to melanocortin receptors or in in vitro or in vivo diagnostics. This control peptide is an AGRP analogue and was used in binding melanocortin receptor binding assays

                                    The present invention relates to a number of cyclic peptide analogues which function as melanocortin receptor ligands. The sequences are given in AAB29201-B29246. These are useful in the treatment of body weight disorders including obesity, anorexia and cachexia, CNS depression, behaviour and memory-related disorders, cardiovascular function, finialmathion, seppis, septic, cardiogenic and hypovolemic shock, sexual dysfunction, erectile dysfunction, muscle atrophy, diseases associated with nerve growth and repair and intrauterine foetal growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              MT-II; piperidine; anorectic; antidiabetic; vasotropic; hypotensive; antilipemic; antiarthritic; osteopathic; cytostatic; hepatotropic; antidepressant; sedative; tranquilizer; antiaddictive; analgesic; antipyretic; antiinflammatory; immunomodulator; antirheumatic; MC-4R;

The invention provides substituted piperidines (I) of specified formula, and their pharmaceutically acceptable salts.(I) are agonists of human melanocortin receptor, an in particular, are selective agonists of human melanocortin receptor (MC-4R). (I) can be used to treat diseases or conditions responsive to the melanocortin receptor, obesity, diabetes mellitus, male or female sexual dysfunction and erectile dysfunction. (I) an also be used to treat hypertension, hyperlipidemia, osteoarthritis, cancer, gall bladder disease, sleep apnea, depression, anxiety, cancer, gall bladder disease, sleep apnea, thereafter abuse, pain, tever, inflammation, immunemodulation, rheumatoid arthritis, skin canning, acne and other skin disoaders. (I) can also be used as neuroprotective agents and for cognitive and memory enhancement including the treatment of Alzheimer's disease. The present sequence represents the sequence of a centrally acting alpha-melanocyte-stimulating hormone analog, melanocan II (MT-II). MT-II is a synthetic cyclic heptapeptide containing a melanocortin receptor binding region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel melanocortin receptor-specific peptides useful for treating sexual dysfunction in mammals, including male sexual dysfunction such as erectile dysfunction, and female sexual dysfunction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Alpha-melanocyte-stimulating hormone; alpha-MSH; vasotropic; sexual response stimulator; sexual dysfunction; erectile dysfunction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               'note= "Linked to residue 7 to form a cyclic peptide"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /note= "Linked to residue 2 to form a cyclic peptide"

                                                                    The present sequence is a peptide of alpha-melanocyte-stimulating hormone (alpha-MSH). alpha-MSH is a melanocortin receptor-specific peptide. This peptide can be used to produce a pharmaceutical composition, which can be used to stimulate sexual response in a mammal, to treat sexual dysfunction in mammal including male sexual dysfunction such as erectile dysfunction, and female sexual dysfunction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   N-acylated piperidine derivative; melanocortin receptor; MC-4R; obesity; diabetes mellitus; sexual dysfunction; erectile dysfunction; insomnia; pyperension; gall bladder disease; hyperlipidaemia; immunomodulation; osteoarthritis; cancer; sleep disorder; depression; cognitive disorder; rheumatoid arthritis; neuroprotective disorder; Alzheimer's disease; armiety; compulsion; inflammation; sleep apnoea; substance abuse; pain; impotence; fever; skin tannin; acne; skin disorder; dysmenorrhoea; alpha-melanocyte-stimulating hormone; melanotan-II; MT-II; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New 4-substituted N-acylated piperidine derivatives useful for treating

The invention relates to a method for treating sexual dysfunction in females comprising a vasoactive agent comprising a vasoactive intestinal polypeptide and/or agonist to the vagina and/or valvar region. The method is used for preventing conditional atrophy and pain during intercourse, for treating vaginal itching and dryness, for enhancing sexual desire and responsiveness in females and for maintaining improvement of the tissue health of the female condition are absence of sexual fantasies and desire for sexual activity, deficiency or absence of sexual fantasies and desire for sexual activity, afficiency or absence of sexual neuropathy, autonomic neuropathy, sclerosis, atherosclerosis, peripheral neuropathy, autonomic neuropathy, diabetes mellitus, substance-induced decreases in sexual desire and configuration muscle tone and tissue health, increases vaginal configuration and minimises collagen misdeposition resulting from hypoxia. This sequence represents an alpha-melanocyte-stimulating hormone (alpha-manalogues), used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      note= "Linked to residue 7 to form cyclic peptide"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     셤
                                                                                     The invention relates to novel 4-substituted N-acylated piperidine derivatives which serve as agonists of human melanocortin receptor (MC-4R). The invention is used for the treatment or prevention of disorders, diseases or conditions responsive to the activation of MC-4R in a mammal comparisons responsive to the activation of MC-4R in a mammal comparison, dispersively, diabetes mellitus, male or female sexual dysfunction, metroservic male of female sexual dysfunction, hypertension, gall bladder disease, cancer, hyperlipidaemia, osteoarthritis, insomnia/sleep disorder, depression, abuse, pain, impotence, loss of libido, fever, immunomodulation, abuse, pain, impotence, loss of libido, fever, immunomodulation, cheumatoid arthritis, skin tannin, acne and other skin disorders.

Communicative disorder and cognitive disorders including the treatment of Alzheimer's disease, premature labour, sexual pain and dysmenorrhoea.

The present sequence is alpha- melanocyte-stimulating hormone analogue, melanotan-II (MT-II) peptide used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Vasoactive intestinal polypeptide; VIP; female sexual dysfunction; vulva;

The present sequence is a cyclic analogue of human alpha-melanocortin stimulating hormone (alpha-MSH). It is an alpha-MSH antagoniet suitable for the invention. A claimed method of identifying compounds useful in regulating invention. A claimed method of identifying compounds useful in regulating insulin registance in obseity and type II diabetes involves administering a compound having MSH biological activity to a genetically modified non-human animal that has a genetic of proopiomalanocortin (Pomc) peptide activity, where administration of the compound induces insulin registance in the animal, and selecting compounds that decrease insulin resistance in the animal. The compound having MSH biological activity is MSH or its fragment, homologue, peptide or non-peptide mimetic, or fusion protein. The compound to be evaluated is preferably an MSH antagonist. A claimed method of decreasing insulin resistance in a mammal involves administering an MSH antagonist.
          Identifying compounds useful in regulating insulin resistance in obesity and type II diabetes by using a proopiomelanocortin null mutant non-human animal as a model.
                                                                                                                                                                                                                                                                                                                                                                              antagonist action, a soluble MSH receptor, or an antibody that selectively binds to MSH. A claimed method to treat diabetes associated with insulin resistance comprises administering a composition comprising an MSH ancagonist that decreases insulin resistance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       note= "Linked to residue 7 to form cyclic peptide"

The present sequence is a cyclic analogue of human alpha-melanocortin stimulating hormone (alpha-MSH). It is an alpha-MSH antagonist suitable for use in a method of the invention. A claimed method of identifying compounds useful in regulating insulin resistance in obesity and type II diabetes involves administering a compound having MSH biological activity to a genetically modified non-human animal that has a genetic modification within 2 alleles of its power locus that result in an absence of proopiomelanocortin (Pomo; peptide activity, where administration of the compound induces insulin resistance in the animal, and selecting the compounds that decrease insulin resistance in the animal. The compound chaving MSH antological activity is MSH or its fragment, homologue, peptide or non-peptide mimetic, or fusion protein. The compound to be evaluated or non-peptide mimetic, or fusion protein. The compound to be evaluated is preferably an MSH antagonist. A claimed method of decreasing insulin resistance in a mammal involves administering an MSH antagonist.

C especially an MSH aragment, homologue, mimetic or fusion protein having antagonist action, a soluble MSH receptor, or an antibody that captured with insulin resistance comprises daministering a composition comprising with insulin resistance comprises andministering a composition comprising companient that decreases insulin resistance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The present invention relates to new 4-substituted acylated piperidine derivatives or their salts. The invention is useful for the treatment or derivation of disorders, diseases or conditions responsive to the activation of the melanocortin-4 receptor in a mammal, e.g. obesity, diabetes mellitus, male or female sexual dysfunction, and erectile dysfunction, hypertension, hyperlipidaemia, obteoarthritis, cancer, gall bladder disease, sleep apnoca, depression, pariety, compulsion, neurosis, insomnia/sleep disorder, substance abuse, pain, impotence, loss of inbido, fever, inflammation, immunomodulation, rheumatorid arthritis, skin tannin, acne and other skin disorders, neuroprotective and cognitive and premature labour sexual pain and dysmenorrhoea. The compounds of the present invention are selective agonists of melanocortin-4 receptor. The present amino acid sequence represents a cyclic melanocatin-7 (MT-II) peptide, as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       4-substituted N-acylated piperidine derivatives useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sexual response; sexual dysfunction; erection; sexual receptivity; psychogenic erectile dysfunction; libido enhancement.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               100.0%; Score 36; DB 5; Length 7; 83.3%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to 4-Substituted N-acylated piperidine derivatives capable of acting as melanocortin 4 receptor antagonist.

These can be used for the treatment or prevention of disorders, diseases or conditions responsive to the activation of the melanocortin-4 receptor in a mammal, e.g. obesity, diabetes mellitus, male or female sexual dysfunction, and erectile dysfunction, hypertension, hyperlipidemia, osteoarthritis, cancer, gall bladder disease, isleep apnea, depression, pain, impotence, loss of libido, fever, inflammation, immunomodulation, rheumatoid arthritis, skin tannin, acne and other skin disorders, cheumatoid arthritis, skin tannin, acne and other skin disorders, treatment of Alzheimer's disease, premature labour sexual pain or treatment of Alzheimer's disease, premature labour sexual pain or dysmenorrhea. The present sequence is a peptide agonist of melanocortin 4 receptor described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                        New 4-substituted N-acylated piperidine derivatives useful for treating, e.g. obesity, diabetes mellitus, sexual dysfunction, osteoarthritis, cancer, acne Alzheimer's disease or dysmenorrhea.

                                                                                                                                                                                                                                                                                 This invention relates to a novel method for bringing erection of the penis to an animal. This method involves administering synthetic peptides disclosed in the invention to a subject. The peptides and methods of the invention may have vasotropic activities. The peptides of the invention and methods using these peptides may be used to induce erection of the penis and may be used for diagnosis of psychogenic erectile dysfunction. The method enhances libido (either by overcoming psychogenic sexual dysfunction in males or bringing sexual receptivity in females) in animals. The present sequence represents a synthetic peptide of the invention which is shown to erection of the penis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cyclic petide #2 for treatment of male psychogenic sexual dysfunction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Linear; cyclic; sexual response; psychogenic sexual dysfunction; male; penile erection; stomach discomfort.
                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                    Bringing erection of the penis to an animal involves administering specific peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                              ö

Diagnosis and treatment of male psychogenic sexual dysfunction - by administering erectogenic amt. of specified hepta- to deca-peptide amide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequences given in AAR65782-88 are linear and cyclic peptides which may be used for bringing about a sexual response or for diagnosing psychogenic sexual dysfunction in males. These peptides specifically bring about penile erection, however at higher doses some stomach discomfort was noted. The peptides were prepared by standard methods of solid phase synthesis. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Linear; cyclic; sexual response; psychogenic sexual dysfunction; male; penile erection; stomach discomfort.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cyclic petide #6 for treatment of male psychogenic sexual dysfunction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note= "forms peptide linkage with Asp3, amidated C-terminal"

                                                                                                                                       Diagnosis and treatment of male psychogenic sexual dysfunction - by administering erectogenic amt. of specified hepta- to deca-peptide amide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note= "the side chain carboxyl group of Asp3 forms a lactam bridge with the epsilon amino group of Lys-NH2 at
                                                                                                                                                                                  The sequences given in AAR65782-88 are linear and cyclic peptides which may be used for bringing about a sexual response or for diagnosing psychogenic sexual dysfunction in males. These peptides specifically bring about penile erection, however at higher doses some stomach discomfort was noted. The peptides were prepared by standard methods of solid phase synthesis. These erectogenic peptides (AAW19921-7) are used in a novel method for inducing penile erection in an animal. They can be used, in conjunction with the efforterore or another androgen, to treat importence in elderly men whose testosterone or another androgen, to treat importence in elderly men whose testosterone or another androgen; to the general response in females also appear to have an effect of increasing sexual response in females. They can be administered to increase libid on female animals of rare species in captivity at the proper time in their osetrus cycle to make them more receptive to coitus. They may also be administered to the mate animal at the same time to induce the erectile response. The peptides may be used in artificial insemination programmes to encourage an animal, e.g. a stallion, to mount a mock female phantom used in the collection of sperm. The peptides invariably induce an erection in men at low doses (e.g. 1-10 mg) and without any detectable side effects when administered systemically. The peptides, at low doses, also allow continued to the detectable side effects and administered systemically. The peptides, at low doses, also allow
Diagnosis and treatment of erectile dysfunction - by administering an erectogenic peptide containing the sequence Nle-Asp-His-D-Phe-Arg-Trp-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /note= "the side-chain carboxyl group of Asp2 forms a lactam bridge with the epsilon amino group of Lys at position 7"

These erectogenic peptides (AAW19921-7) are used in a novel method for inducing penile erection in an animal. They can be used, in conjunction with the referosterone or another androgen, to treat importence in elderly men whose testosterone or another androgen, to treat importence in elderly men whose testosterone levels are declining with age. The peptides also appear to have an effect of increasing sexual response in females. They can be administered to increase libido in females. They care species in captivity at the proper time in their oestrus cycle to make them more receptive to coitus. They may also be administered to the mate animal at the same time to induce the erectile response. The peptides may be used in artificial insemination programmes to encourage an animal, e.g. a stallion, to mount a mock female phantom used in the collection of sperm. The peptides invariably induce an erection in men at low doses (e.g. 1-10 mg) and without any detectable side effects when administered systemically. The peptides, at low doses, also allow and account to administered bystemically. The peptides, at low doses, also allow
                              group of Lys7 forms a lactam
                                                                                                                                                                                                                                                                                                                                                                                Diagnosis and treatment of erectile dysfunction - by administering an erectogenic peptide containing the sequence Nle-Asp-His-D-Phe-Arg-Trp-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New cyclic peptide analogues of alpha-melanocyte stimulating hormone - for treatment of hypo:pigmentation and for darkening human hair or animal pelts, have prolonged action.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This peptide is a synthetic, cyclic analogue of human alpha melanocyte stimulating hormone (alpha-MSH). It is used to stimulate mammalian melanocytes to produce integumental melanin, i.e. to treat hypopigmentation such as pityriasis alba, timea versicolor, vitiligo, idiopathic guttae hypomelanosis and nevus depigmentosus. It can also be used to darken grey hair and to increase the value of animal pelts. The peptide can replace alpha-MSH, or its Nle4 analogue, in all diagnostic, therapeutic and research applications, e.g. localisation/characterisation of melanoma cells, and as ligand to deliver anticancer or diagnostic agents. Also treatment with the peptide darkens the skin without any exposure to UV light. In a bioassay on frog skin the present activity of 1.0, (identical to native alpha-MSH)
                                                                                        /note= "The carboxyl group side chain of Asp at position 3 forms a lactam bridge with the side chain amino group of Lys-NH2 at position 8"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 OTHER INFORMATION: cyclic from position 2 to position 7;
OTHER INFORMATION: Xaa at position 1 is norleucine; Xaa at positon 4 is D-2'-nap
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ó;
                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                    position 1 is
No. 5674839leucine; position 4 is D-phenylaline
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 1, Application US/08420972A
Sequence 1, Application US/08420972A
Patent No. 5731408
GENERAL INFORMATION:
PAPLICANT: Mac E. Hadley, Victor J. Hruby and Shubh Sharma
TITLE OF INVENTION: PEPTIDES HAVING POTENT ANTAGONIST AND
TITLE OF INVENTION: AGONIST BIOACTIVITIES AT MELANOCORTIN RECEPTORS
NUMBER OF SEQUENCES: 3
CORRESPONDENCE ADDRESS:
ADDRESSEE: Yahwak & Associates
STREET: 25 Skytop Drive
CITY: Trumbull
STATE: Connecticut

Sequence 6, Application US/09374827

Patent No. 6603058

Patent No. 6603058

Patent No. 6603058

TITLE OF INVENTION:

APPLICANT: Hochgeschwender, Ute

TITLE OF INVENTION: "NON-HUMAN ANIMAL MODEL FOR OBESITY AND USES THEREOF"

FILE REFERENCE: 3718-5

CURRENT FAPLICATION NUMBER: 60/11,581

EARLIER APPLICATION NUMBER: 60/11,581

EARLIER FILING DATE: 1999-07-29

NUMBER OF SEQ ID NOS: 8

SOFTWARE: PATENT NOS: 8

SOFTWARE: PATENT NOS: 8

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 4, Application US/08349902B; Patent No. 5674839; GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: Linear and Cyclic Analogs of TITLE OF INVENTION: alpha-MSH fragments
NUMBER OF SEQUENCES: 34
CORRESPONDENCE ADDRESS:
ADDRESSEE: Yahwak & Associates
STREET: 25 Skytop Drive
STREET: 25 Skytop Drive
STREET: Connecticut
                                             COMPUTER READABLE FORM:
MEDIUM TYPE: floppy disk
COMPUTER: Macincoh
OPERATING SYSTEM: MS-DOS
SOFTWARE: Microsoft Word 5.0
CURRENT APPLICATION DATA:
PPLICATION NUMBER: US/08/349,902B
FILING DATE: 6-DEC-1994
CLASSIFICATION S30
ATTORNEY/AGENT INFORMATION:
NAME: George M. Yahwak
REGISTRATION NUMBER: 26,824
REPERENCE/COCKET NUMBER: 26,824
REPERENCE/COCKET NUMBER: UA 816 CIP
TELECHONE: (203)268-1951
TELECHONE: (203)268-1951
INFORMATION FOR SEQ 10 NO: 17:
SEQUENCE CHARACTERISTICS:
LENGTH: 7 aming acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ZIP: 06611

Sequence 21, Application US/08349902B
Patent No. 5674839
GENERAL INFORMATION:
APPLICANT: Victor J. Hruby et al
TITLE OF INVENTION: Linear and Cyclic Analogs of
TITLE OF INVENTION: alpha-MSH fragments
NUMBER OF SEQUENCES: 34
CORRESPONDENCE ADDRESS:
                ATTORNEY AGENT THORMATION:
ATTORNEY AGENT THORMATION:
NAME: George M. Yahwak
REGISTRATION NUMBER: 26,824
REFERENCE/COCKET NUMBER: UA 816 CIP
TELECOMMUNICATION INFORMATION:
TELEPRONE: (203) 268-1951
INFORMATION FOR SEQ ID NO: 20:
SEQUENCE CHARACTERISTICS:
LENGTH: 7 amini acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            COMPUTER READABLE FORM:

COMPUTER READABLE FORM:

MEDIUM TYPE: 1.0ppy disk

COMPUTER: Macintosh

OPERATING SYSTEM: MS-DOS

SOFTWARE: Microsoft Word 5.0

Fatent No. 5674339

Patent No. 5674339

GENERAL INFORMATION:

APPLICANT: Victor J. Hruby et al

TITLE OF INVENTION: Linear and Cyclic Analogs of

TITLE OF INVENTION: alpha-MSH fragments

TITLE OF SEQUENCES: 34

CORRESPONDENCE BADRESS:

ADDRESSES: Yahwak & Associates

STREET: 25 Skytop Drive

CITY: Trumbull
